ARCHIDATA
DIGITAL TWIN

Smart Property Management

Archidata offers a web solution for real estate managers. The plans archived on the Archidata platform are leveraged by extracting the information needed for space management and making it accessible rapidly and securely.

Reliable information when you need it

The Archidata Solution integrates with existing management systems. It is a global solution that follows the life cycle of a building. Our platform offers a set of tools for three sectors of activities: assets, operations and projects. Many tools are offered to provide reliable information for all real estate activities.

The Archidata Solution generates the spatial **digital twin** from AutoCAD and Revit files and updates it as your building evolves!

Archidata also offers a complete solution via API for mapping your BIoT!
